

Cedefop country fact sheet

Adult population with potential for upskilling and reskilling

Sweden

Country fact sheets originate from the comparative analysis presented in Cedefop's 2020 study [*Empowering adults through upskilling and reskilling pathways. Volume 1: adult population with potential for upskilling and reskilling.*](#)

Due to data limitations, part of the analysis could not be performed at country level. The fact sheets are intended to stimulate reflection on whether the groups with the most potential for upskilling, according to the analysis conducted, are in line with defined national priorities. Analysis underpinning the country fact sheets could also be replicated using national data to overcome some of the limitations of the EU comparable data sets used.

Disclaimer

This fact sheet contains UK data and analysis based on research conducted before the United Kingdom's exit from the European Union on 31 January 2020. EU averages or other statistical parameters including the UK reflect the situation in the European Union before 31 January 2020 and should not be considered as representative of the situation in the EU thereafter. In this context 'EU-28' refers to the 28 EU Member States prior to 31 January 2020.

This fact sheet has neither been edited nor proofread by Cedefop's editing service.

Introduction

Due to data limitations, analysis of the low-skilled has been generally carried out using educational attainment levels or type of occupation ⁽¹⁾. However, as discussed in Cedefop (2017), this approach fails to capture the complexity of the low-skilled phenomenon. Educational attainment does not take into account different types of skills, abilities and factors that can result in low-skilled status, especially among adults: long-term unemployment and/or disengagement from the labour market, skill obsolescence due to ageing, rapid technological change, product/process innovation, changes in production processes and/or work organisation, skills mismatch and socioeconomic factors, such as migrant background and gender.

Further, this narrow conceptualisation fails to capture the role of other knowledge, skills and competences gained outside formal education environments, such as those acquired through training, informal learning and work experience.

Within this context, and in line with Cedefop (2017), Cedefop's study [*Empowering adults through upskilling and reskilling pathways. Volume 1: adult population with potential for upskilling and reskilling*](#) adopts a definition of low-skilled status for adults which moves beyond educational attainment, to embrace the different dimensions comprising the overall skills and competences of adults.

This broader conceptualisation of low skills looks at three skills dimensions:

- (a) educational attainment level;
- (b) computer and digital skills;
- (c) cognitive skills: literacy and numeracy.

It also includes adults with medium and high education levels, working in elementary occupations, as a proxy for people in potential risk of skill obsolescence and skill loss ⁽²⁾.

For the purpose of the analysis underpinning this fact sheet, adults are people aged from 25 to 64. EU 28+ refers to the 28 EU Member States, plus Iceland and Norway.

Boxes 1 and 2 illustrate the main definitions and the source of information of the different skill domains used for the analyses.

⁽¹⁾ Dieckhoff, 2008; Eurofound, 2008.

⁽²⁾ Several studies show that job-worker mismatches induce cognitive decline with respect to immediate and delayed recall abilities, cognitive flexibility and verbal fluency (De Grip et al., 2008; Kureková, Haita and Beblavý, 2013; Kureková et al., 2013).

Box 1. **Concepts of low skills used in the analysis: definition and source**

Educational attainment level:

- low education refers to people who have successfully completed, at most, international standard classification of education (ISCED) levels 0-2 or ISCED 3c programmes lasting less than two years. ISCED 2011 is the reference international classification for organising education programmes and related qualifications by levels and fields:
 - ISCED 0: pre-primary education;
 - ISCED 1: primary education;
 - ISCED 2: lower secondary education;
 - ISCED 3: upper secondary education.[Source of data used: European Union Labour Force Survey (EU LFS) 2016 anonymised microdata for research].

Digital skills:

- never used computer: refers to people who declare of having never used a computer [Source of data: Eurostat community statistics on information society (CSIS) 2015 anonymised microdata for research; CSIS 2014 for Iceland];
- low use of internet: refers to people who last used the internet more than three months prior to the survey interview or who have never used the internet [Source of data: CSIS 2015 anonymised microdata for research; CSIS 2014 for Iceland];
- below basic digital skills: among those people with last use of the internet less than three months prior to the survey interview, individuals who have carried out activities in, at most, one of the four digital competence dimensions surveyed: information, communication, content-creation and problem-solving [Source of data: CSIS 2015 anonymised microdata for research];
- low digital skills: refers to people who have either low use of the internet or below basic digital skills [Source of data: CSIS 2015 anonymised microdata for research];
- low problem-solving in technology-rich environments: refers to people who scored less than 241 points in PIAAC (i.e. below level 1 on the proficiency scale ranging from level 1 to level 3 of OECD PIAAC). Problem-solving in technology-rich environments is defined as 'using digital technology, communication tools and networks to acquire and evaluate information, communicate with others and perform practical tasks'. [Source of data: PIAAC 2012; 2015 public use files].

Cognitive skills:

- low literacy refers to people who scored less than 226 points in PIAAC (i.e. at most, level 1 on the proficiency scale ranging from below level 1 to level 5 of OECD PIAAC). Literacy refers to the ability to understand, evaluate, use and engage with written texts to participate in society, achieve one's goals, and develop one's knowledge and potential. [Source of data: PIAAC 2012; 2015 public use files];
- low numeracy refers to people who scored less than 226 points in PIAAC (i.e. at most, level 1 on the proficiency scale ranging from below level 1 to level 5 of OECD PIAAC). Numeracy refers to the ability to access, use, interpret and communicate mathematical information and ideas in order to engage in, and manage the mathematical demands of, a range of situations in adult life. [Source of data: PIAAC 2012; 2015 public use files];
- low cognitive skills: refers to people with low literacy and/or numeracy (see above) [Source of data: PIAAC 2012; 2015 public use files].

At risk of skill loss:

- medium-high educated at risk of skill loss: refers to people who have medium and high educational attainment levels and work in elementary occupations (international standard classification of occupations ISCO-08, group 9). Where, medium education is defined as having completed ISCED 3 programme of duration of two years or more or ISCED level 4 (post-secondary education), and high education is defined as having completed ISCED levels 5-8 (tertiary education). ISCED 2011. [Source of data used: EU LFS 2016 anonymised microdata for research].

Source: Cedefop.

Box 2. Data sources

EU LFS 2016 anonymised microdata for research ⁽³⁾

The Eurostat-European Union labour force survey provides robust information for all the 28EU+ countries on labour market conditions and characteristics of low-educated adults and jobs. It contains data on a wide range of sociodemographic characteristics of individuals including education (ISCED) and training participation (in the four weeks before the survey interview), as well as on employment status and employment characteristics of the main job, including occupation (ISCO).

<https://ec.europa.eu/eurostat/web/microdata/labour-force-survey>

CSIS 2015 anonymised microdata for research ⁽⁴⁾

The Eurostat Community statistics on information society survey provides information on access and use of information and communication technologies (including computer use, internet access, digital competences) by households and individuals aged 16 to 74 in the EU-28+. It contains background information on gender, age, education level, employment status, occupation (manual vs non-manual job). CSIS 2015 covers the EU-28+ countries, apart from Iceland. CSIS 2014 have been used for Iceland.

<https://ec.europa.eu/eurostat/web/microdata/community-statistics-on-information-society>

PIAAC 2012; 2015 public use files – anonymised microdata ⁽⁵⁾

The Programme for the international assessment of adult competences (OECD PIAAC) contains information on cognitive skills (literacy and numeracy), problem-solving in technology-rich environments, computer experience, level of education (ISCED) and training, as well as, on a range of demographic, economic and social variables, including occupations (ISCO). PIAAC covers in total 21 countries of the EU-28+:

- 18 surveyed in round one (2012): AT, BE, CY, CZ, DE, DK, EE, ES, FI, FR, IE, IT, NL, NO, PL, SE, SK, UK;
- three surveyed in round two (2015): EL, LT, SI.

Hence, the following EU-28+ countries are not covered by this survey: BG, HR, HU, IS, LU, LV, MT, NO, PT, RO. Some other countries did not participate in the assessment of proficiency in problem-solving in technology-rich environments: CY, ES, FR and IT.

How many adults at risk of low skills?

In Sweden the incidence of low skills among adults is lower than that observed on average in the EU28+ countries in all the skills domains considered, for which reliable data is available (Fig.1). On the other end, the gap with best performing countries (i.e., those countries having the lowest shares of low skilled adult populations) is relatively low for what concerns the share of adults with low cognitive skills (literacy and numeracy) and skills and problem solving in technology-rich environments.

Figure 1 – Incidence of low skills among adults aged 25-64 by type of skills (%)

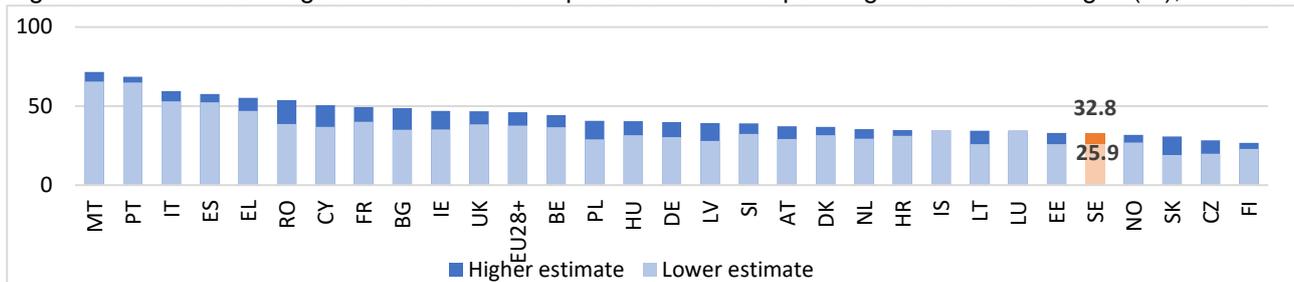

Note: European average: unweighted average of EU28+ countries for which data are available. u: unreliable data. Best performer countries (those with reliable data) with the lowest share of low-skilled adult population aged 25-64. Best performer: Low education (LT), Never used computer (NL), Low use of Internet (FI), Below basic digital skills (LU), Low literacy (FI), Low numeracy (CZ), Low problem solving in technology-rich environments (NO)

Estimation of the adult population with potential for upskilling and reskilling

In Sweden the share of adult population with potential for upskilling and reskilling is estimated to range between 25.9% and 32.8% of the total adult population, that is to say from 1.3 to 1.6 million adults, depending on the measure of digital competences considered.

Figure 2- Adults aged 25-64 with potential for upskilling and reskilling (%), EU28+

Note: Population with potential for upskilling (estimate): adults with either: low education; low digital skills (higher estimate) or never used computer (lower estimate); low literacy and/or low numeracy; as well as medium-high educated (ISCED2011 level 3 2-year+ to level 8) at risk of skill loss, working in elementary occupations- ISCO08 level 9). For countries not surveyed by PIAAC (BG, HR, HU, IS, LU, LV, MT, PT, RO), low cognitive skills (low literacy and/or low numeracy skills) is assumed to be equal to the average level observed in surveyed countries. EU28+: population weighted average.

Who are the adults most at risk of low skills?

Due to data limitation and reliability, identification of the groups of adults most at risk of low skills, and by skill dimension, could be performed only by labour market status (unemployed, inactive and employed) and by age groups (young adults aged 25 to 34, adults aged 35 to 54 and older adults aged 55 to 64). When data were available and reliable at country level, in the country factsheets, this analysis was complemented by analysis by gender and country of origin.

The risk of being low-skilled has been calculated using the four indicators illustrated in box 3.

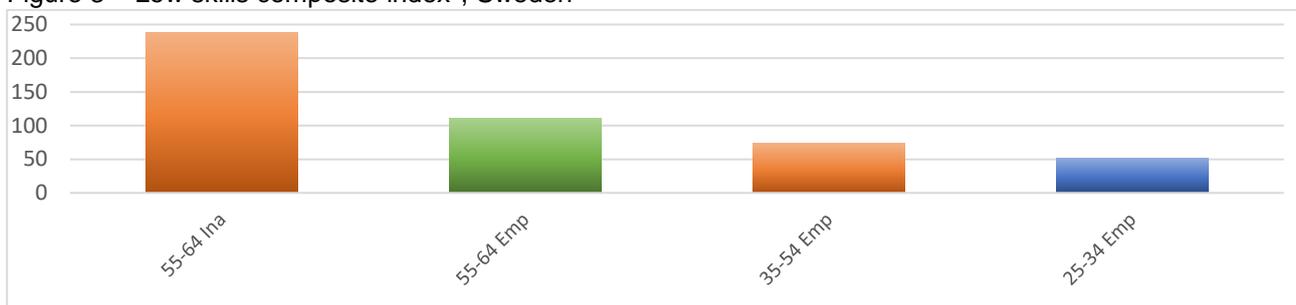

Box 3. Measures of low skills used in the analysis

- (a) **the absolute risk of low skills**, calculated as the simple share of individuals with low skills among those of the same sociodemographic subgroup ⁽⁶⁾. It represents the incidence of low skills in the subgroup population;
- (b) **the relative risk of low skills**, calculated as the share of low-skilled adults in the sociodemographic subgroup (absolute risk) over the share of low-skilled among the whole adult population aged 25 to 64 in the country ⁽⁷⁾. It compares the incidence of low skills in the subgroup to the incidence of low skills in the total adult population of the country. Values above/below 100 indicate that the risk of low skills is higher/lower for the subgroup than the average risk observed for the total adult population of the country;
- (c) **the low skills composite index**, calculated as the arithmetic mean of the relative risk of low skills in education, digital skills, literacy and numeracy. It provides the average risk of low skills in the four domains analysed. Again, values of the index above/below 100 indicate a higher/lower than average risk;
- (d) **the relative performance index of low skills**, calculated as the relative risk of low skills within the country over the relative risk of low skills observed on average in the EU-28+ for the same sociodemographic subgroup ⁽⁸⁾. It compares the relative performance in terms of low skills of the subgroup in the country to the relative performance of the subgroup in the EU-28+ as a whole. Values above 100 indicate that the relative risk of low skills registered by the subgroup within the country is higher than the one registered by the same subgroup on average in the EU-28+. As opposite, values below 100 indicate a lower relative risk.

Source: Cedefop.

In Sweden low skills are particularly high among inactive people in the older age group. (Fig. 3). However, for Sweden data on digital skills broken down by age and employment status are not reliable for all groups investigated.

Figure 3 – Low skills composite index*, Sweden

(* Low skills composite index: calculated as the arithmetic mean of the relative risk of being low skilled in four domains: Low Education; Low Digital skills; Low literacy, Low numeracy. For each skill domain, the relative risk is calculated as the share of low skilled in the

⁽⁶⁾ Absolute risk of low skills calculated as:
(low skilled population) ij / (total population) ij ; where subscript i refers to subgroup and j to country.

⁽⁷⁾ Relative risk of low skills calculated as:
 $\{[(\text{low-skilled population})_{ij} / (\text{total population})_{ij}] / [(\text{low-skilled population})_i / (\text{total population})_i]\} \times 100$; where subscript i refers to subgroup and j to country.

⁽⁸⁾ Relative performance index calculated as: $[(\text{relative risk of low skills})_{ij} / (\text{relative risk of low skills})_{iEU28+}] \times 100$; where subscript i refers to subgroup, j to country and EU28+ to European average.

socio-demographic group over the share of low skilled among adults aged 25-64 in the country. Values of the indicator below 100 indicate a lower than average risk; values above 100 indicate higher than average risk.

Source: Eurostat, a [2016]; Eurostat, b [2015]; OECD, a; b.

Unemployed adults

Among the unemployed, those aged 55-64 show a very high risk of having low numeracy, while individuals aged 35-54 show the highest risk of having low educational attainment levels (Tab. 1). Unfortunately, data on digital and cognitive skills is not reliable for all the age groups.

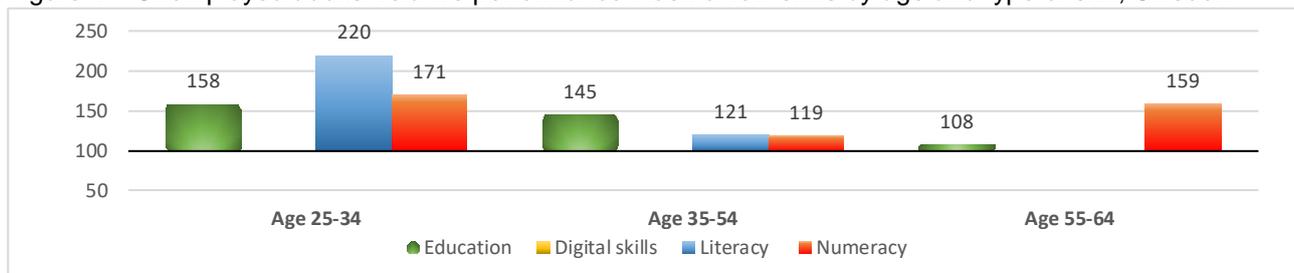

Table 1- Unemployed adults: absolute risk of being low skilled by age and type of skill, Sweden

Age	Education	Digital skills	Literacy	Numeracy
55-64	29,7	u	u	40,8
25-34	29,6	u	34,2	33,2
35-54	36,8	u	27,1	28,3
Total pop 25-64: Country average	14,9	24,3	13,8	15,2
Total pop 25-64: European average	23,2	43,0	20,8	24,3

Note: European weighted average: Education (EU28+); Digital skills (EU28, NO); Literacy and Numeracy (AT, BE, CY, CZ, DE, DK, EE, EL, ES, FI, FR, IE, IT, LT, NL, NO, PL, SE, SI, SK, UK). u: unreliable data.

Unlike the absolute risk, the **relative performance index** of low skills (Fig. 4) evidences country critical areas (those above 100) for socio-demographic groups as compared to the performance they register on average across the EU 28+. In Sweden, for instance, unemployed young adults aged 25-34 have a higher relative risk of having low education, low literacy and numeracy, as compared to the relative risk observed on average by the same group in EU 28+, while adults aged 55-54 show a higher relative risk of having low numeracy.

Figure 4 – Unemployed adults: relative performance index of low skills by age and type of skill, Sweden

Note: **Relative risk of low skills within the country over the relative risk of low skills observed on average in EU28+ for the same socio-demographic group.** Values of the index below/above 100 indicate that the relative risk of low skills for the specific socio-demographic group in the country is lower/higher as compared to the relative risk for the specific socio-demographic group in the EU 28+ average.

Inactive adults

Among inactive adults, the groups most at risk of low skills in all the skill dimensions considered are those aged 55-64 and 35-54. Adults aged 55-64 show a relatively high risk of low skills especially in digital skills, while adults aged 35-54 show a relatively high risk especially in cognitive skills (literacy and numeracy). Moreover, also inactive adults aged 25-34 show higher risks of low skills in education and cognitive skills, with respect to the risks registered on average in the country and at the EU 28+ level (Tab. 2).

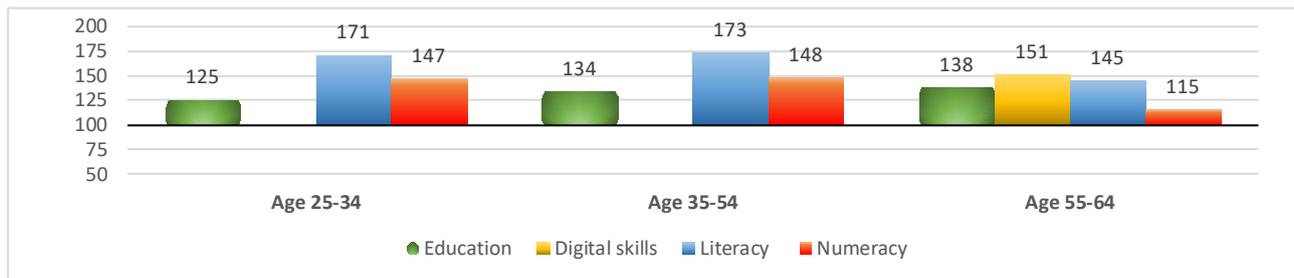

Table 2- Inactive adults: absolute risk of being low skilled by age and type of skill, Sweden

Age	Education	Digital skills	Literacy	Numeracy
55-64	36,7	65,7	34,2	30,4
35-54	37,1	u	37,2	40,8
25-34	24,3	u	26,5	29,7
Total pop 25-64: Country average	14,9	24,3	13,8	15,2
Total pop 25-64: European average	23,2	43,0	20,8	24,3

Note: European weighted average: Education (EU28+); Digital skills (EU28, NO); Literacy and Numeracy (AT, BE, CY, CZ, DE, DK, EE, EL, ES, FI, FR, IE, IT, LT, NL, NO, PL, SE, SI, SK, UK). u: unreliable data.

Unlike the absolute risk, the relative performance index of low skills (Fig. 5) pinpoints country critical areas (those above 100) for socio-demographic groups as compared to the performance they register on average across the EU 28+. In Sweden inactive adults of all age groups have a higher relative risk of having low education, low literacy and low numeracy as compared to the relative risk observed on average by the same groups in the EU 28+.

Figure 5 – Inactive adults: relative performance index of low skills by age and type of skill, Sweden

Note: **Relative risk of low skills within the country over the relative risk of low skills observed on average in EU28+ for the same socio-demographic group.** Values of the index below/above 100 indicate that the relative risk of low skills for the specific socio-demographic group in the country is lower/higher as compared to the relative risk for the specific socio-demographic group in the EU 28+ average.

Employed adults

Among employed adult, the group most at risk of low skills in education and digital skills are people aged 55-64. Whereas, the other two groups show a lower risk of low skills compared to the risks registered on average in the country and at EU 28+ level (Tab. 3).

Table 3- Employed adults: absolute risk of being low skilled by age and type of skill, Sweden

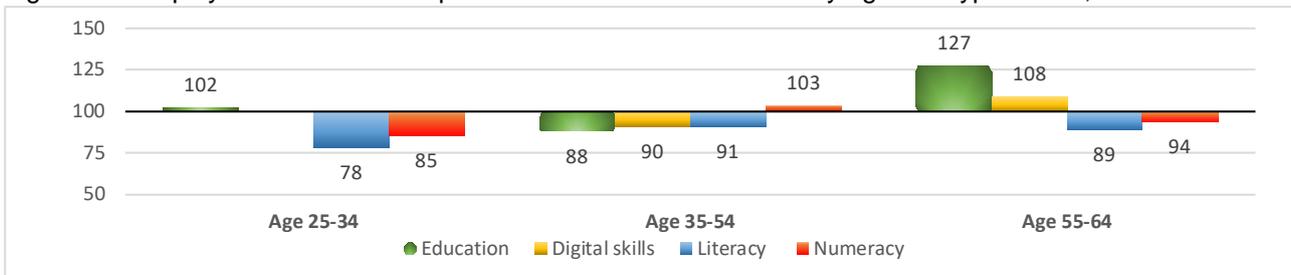

Age	Education	Digital skills	Literacy	Numeracy
55-64	18,8	30,4	13,8	15,2
35-54	9,9	18,8	10,1	12,5
25-34	8,2	u	6,3	7,6
Total pop 25-64: Country average	14,9	24,3	13,8	15,2
Total pop 25-64: European average	23,2	43,0	20,8	24,3

Note: European weighted average: Education (EU28+); Digital skills (EU28, NO); Literacy and Numeracy (AT, BE, CY, CZ, DE, DK, EE, EL, ES, FI, FR, IE, IT, LT, NL, NO, PL, SE, SI, SK, UK). u: unreliable data.

The **relative performance index** of low skills (Fig. 6) highlights country critical areas (those above 100) for socio-demographic groups as compared to the performance they register on average across the EU 28+. In Sweden employed adults aged 55-64 have a higher relative risk of having

low education and digital skills as compared to the relative risk observed on average by the same group in the EU 28+.

Figure 6 – Employed adults: relative performance index of low skills by age and type of skill, Sweden

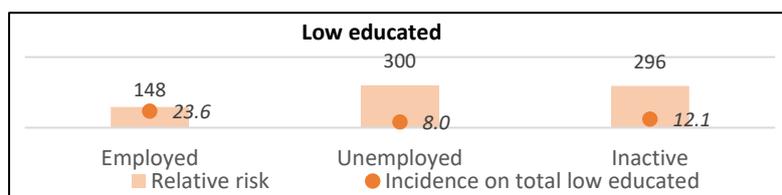

Note: **Relative risk of low skills within the country over the relative risk of low skills observed on average in EU28+ for the same socio-demographic group.** Values of the index below/above 100 indicate that the relative risk of low skills for the specific socio-demographic group in the country is lower/higher as compared to the relative risk for the specific socio-demographic group in the EU 28 + average.

Box 4 – Risk of low skills among foreign-born adults

According to the EU- Labour Force Survey in Sweden foreign-born residents (2016) accounted for 22.7% of the total population aged 25-64, of which 74.1% were born outside the EU28. Foreign-born adults account for approximately 44% of the population with low education, 58% with low literacy and 52% with low numeracy. However, when looking at the low skills gap and at the relative risk within the country, low literacy skills, and to a lesser extent also numeracy skills, are most prominent among this group of adults.

Foreign born aged 25-64	Low education	Low literacy	Low numeracy
Incidence on the low skilled population (%)	43.7	57.8	52.3
Low skills gap*	20.9	39.0	33.5
Absolute risk (%)	28.6	42.6	42.3
Relative risk within the country	192	308	279

The breakdown by employment status shows that the risk of having a low educational attainment level is particularly high among foreign-born people out of the labour force and unemployed (three times higher than the average level registered in the country). Moreover, among foreign born the risk of having a low educational attainment level is also higher than the country average for employed individuals, as is the incidence on the total adult population with low educational attainment levels: 23.6%.

Box 5 – Risk of low skills among adult women

In Sweden, women account for approximately 47% of the adult population with low education, for about 51% of the population with low digital skills and low literacy, and for 57% of the population with low numeracy. Among adult women, the absolute risk of low skills is higher for digital skills (26%) as compared to the other skill dimension considered. However, when compared to the average risk (relative risk of low skills) women show a higher risk of having low numeracy (14% higher).

The breakdown by employment status shows that the relative risk of low skills is higher among women out of the labour force (inactive) and among unemployed women in all the skill dimensions considered. Low skilled inactive adult women represent between 16% and 22% of the low skilled adult population, depending on the skill dimension considered.

Females aged 25-64	Low education		Low digital skills		Low literacy		Low numeracy	
Absolute risk of low skills among fem 25-64 (%)	14.1		25.9		14.1		17.8	
Relative risk of low skills: total fem 25-64	95	(46.5)	105	(51.5)	102	(50.4)	114	(56.5)
Relative risk: unemployed fem 25-64	221	(4.7)	u		191	(3.9)	192	(3.9)
Relative risk: inactive fem 25-64	232	(16.1)	u		265	(22.3)	245	(20.6)
Relative risk: employed fem 25-64	64	(25.6)	83	(31.8)	62	(24.1)	82	(31.9)

(Incidence of low skilled females 25-64 on total low skilled population in %). u: unreliable data.
